

The oldest croc eggs have been discovered in a dinosaur nest, according to a [BBC News article](#) published on March 9, 2017.

The article says “this new discovery from Portugal extends the knowledge of this type of egg by approximately 40 million years.” It goes on to say “the fossil record tells us that crocodiles and their relatives were much more diverse in the past.”

Crocodile eggs have changed little in shape in the last 150 million years

But notice what is also said: “They are remarkably similar to the eggs of modern crocodiles, suggesting crocodile eggs have changed little in shape in the last 150 million years.”

No change for 150 million years? Really? Could it be that the Bible is true after all?

According to [Genesis 1:24-25](#), God made billions of creatures “all according to their various kinds” (REB), who would also reproduce “after its kind” (NASB). So, small variations with each kind, but no wholesale changes from one kind to another, even after many millions of years.
